CCS2112 Web Application Development Tutorial 3 – Bootstrap & Responsive Web Design

*Due Date: Monday October 19, 2026, at 23:59 – You will **not** be able to submit your tutorial after October 21, 2026, at 23:59.*

In Your Assignment Groups:

Continue developing your Student Web Application from Tutorial 2 using Bootstrap and responsive web design.

1. **Update the Student Registration Form**: Modify your existing 'registration.html' file to use Bootstrap for styling – you may now implement login logic, your 'Submit/Register' button should open the portal after **successful** data validation. Use appropriate Bootstrap classes to improve the layout, form controls, buttons and spacing. Ensure that the form is responsive on different screen sizes. Retain the JavaScript validation from Tutorial 2 – the login variables may be stored/handled my JavaScript and do not need to be 'remembered' after the session/window is closed.
2. Create a Student Portal Homepage: Create a new 'portal.html' file for a Student Portal homepage. It must contain a navigation bar, a welcome/hero section, and at least three course or learning-resource cards. Use Bootstrap's grid system and components to create a clean, responsive layout.
3. Apply Custom Styling: Use your own 'style.css' file to add custom styling, such as colours, fonts, spacing and other design improvements that complement Bootstrap.
4. Test Your Web Application: Test both webpages to ensure that the layouts adjust to different screen sizes, all links and stylesheets work correctly, and the registration form's JavaScript validation still functions as expected.

Submission:

- 'registration.html' – Updated Bootstrap-styled registration form.
- 'portal.html' – Responsive Student Portal homepage.
- 'script.js' – JavaScript validation from Tutorial 2 – make corrections/updates where necessary and rename the file accordingly.
- 'style.css' – your custom CSS styling – build up from what you started with.
- Screen recording demonstrating your webpages, responsiveness and registration form validation. You can use Windows Snipping Tool or another screen-recording tool. 2 min max.

Instructions:

Upload all required files in a **compressed (zipped)** folder. The submission must include a screen-recorded video demonstrating the functionality of your work, including the registration form validation and a walkthrough of both webpages. Demonstrate how your webpages appear at different screen sizes – you may use *Developer Tools* in your browser.

Name your zipped folder using the following format: 'Group2-1_Tutorial3_Submission.zip', where Group 2 refers to your class group and Tutorial Group 1 refers to your assignment group. Replace these numbers with your actual group details.

Upload the zipped folder to your group's Google Drive or OneDrive folder and ensure that access has been granted. Paste the folder link into the submission form.

Important: Continue working on the same Student Web Application from Tutorial 2. Bootstrap may be included using a CDN; you do not need to download or submit Bootstrap's own files.
